

# Well Pad Design And Heavy Truck Freight Transport

Nick Tonias, P.E.

# The CEDRA Corporation

- 1985** The CEDRA Corporation is established.
- 1987** CEDRA begins a long standing relationship with ESRI.
- 1993** CEDRA becomes an authorized ESRI Business Partner and Developer.

CEDRA offers engineering/GIS solutions in the form of **software** and **services** to governmental agencies, engineering consultants, tax assessors, oil companies and various utility enterprises.

# The CEDRA Approach

- ◆ Develop ArcGIS and ArcGIS Server based problem-solving applications
- ◆ Utilize ArcGIS as the interface for graphical display, database interaction and data storage
- ◆ Desktop: VB6, .Net, Python
- ◆ Server: JavaScript, JQuery, HTML, CSS

# Stuart asks how to perform

## Setting Well Pad Elevations

“I seldom talk to humans but when I do I talk to this guy”

# The Desired Goal

**Given a Well Pad Surface with an Initial Control Elevation, change the Control Elevation by raising or lowering the elevation until the Cut and Fill volumes are within a user-specified tolerance within ArcGIS**

**“Balanced Earthwork”**

# The Desired Goal in Picture Form

# Developing the Original Ground Surface

## GPS Field Collected Ground Survey

# Developing the Original Ground Surface

## Create the Original Ground TIN

# Developing the Well Pad Surface

## Set the Well Pad Perimeter Points From Survey Data or Interactively Entered

The screenshot displays the ArcGIS interface with a 'Select By Attributes' dialog box open. The dialog box is configured as follows:

- Layer: jmas\_ptspn
- Method: Create a new selection
- Attributes: [LAYER], [ROT], [SCL], [PTCODE], [PTDESC]
- Operator: Is
- Expression: [PTCODE] = 'WP'

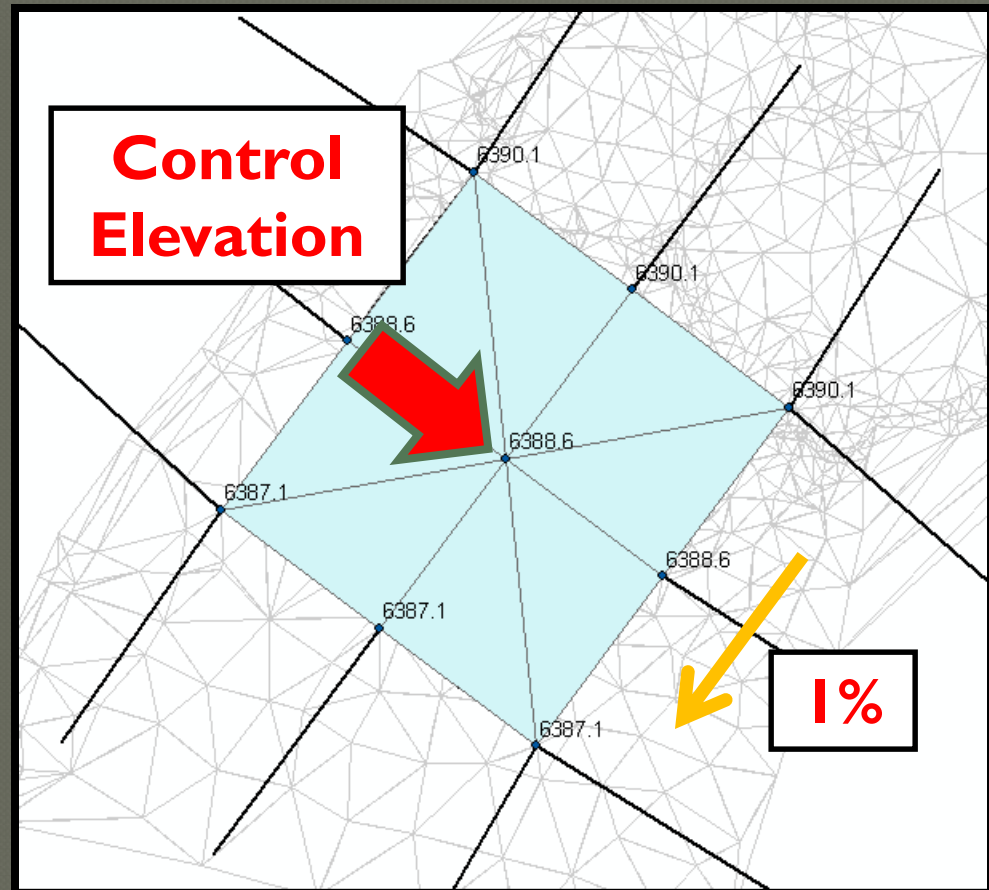

The background shows a well pad surface grid with several points highlighted in cyan and green, indicating they have been selected based on the criteria.

# Developing the Well Pad Surface

## Well Pad TIN – Option I Sloped Surface

A Specific Elevation on the Well Pad Surface acts as the control point when balancing earthwork which enables the Well Pad to be sloped for drainage

# Developing the Well Pad Surface

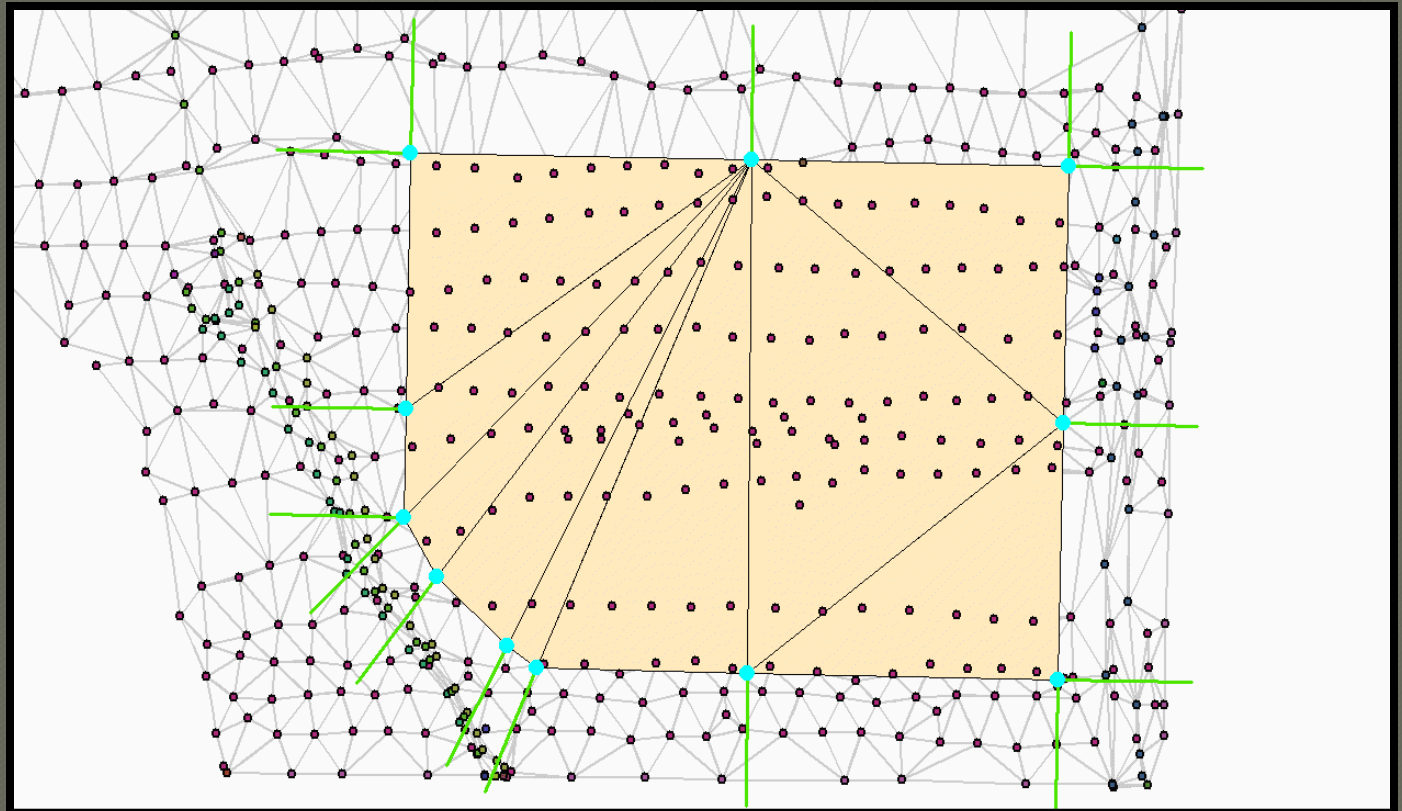

## Well Pad TIN – Option 2 Constant Pad Elevation

# Developing the Slope Lines

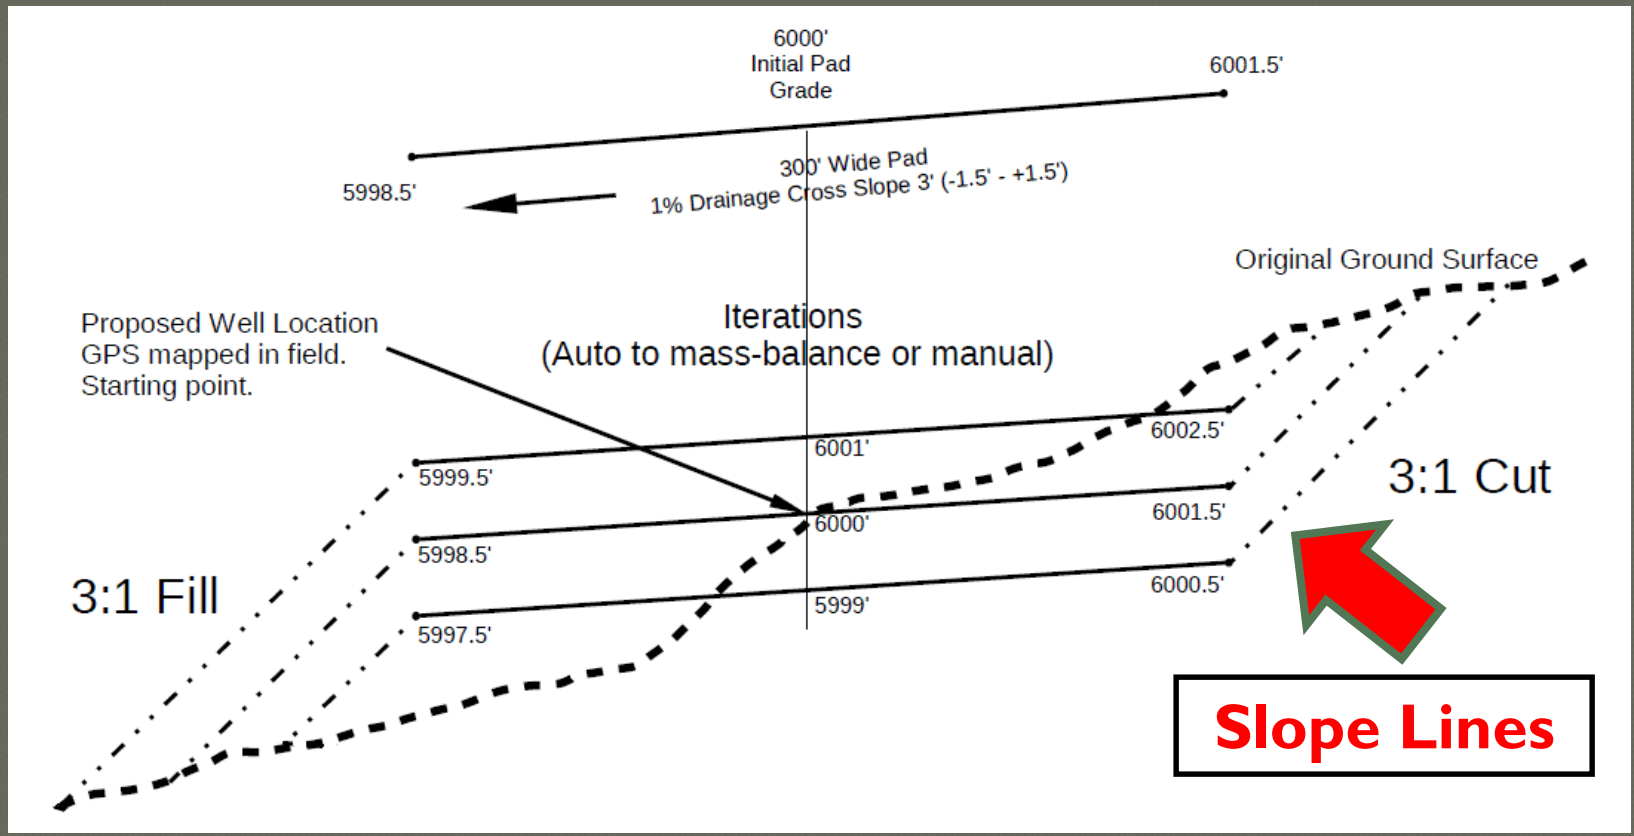

Slope Lines defined at Well Pad Perimeter Points  
1 on 2, 1 on 3, 1 on 4, etc.

Slope  
Lines tie  
the Well  
Pad  
Surface  
to the  
Original  
Ground  
Surface

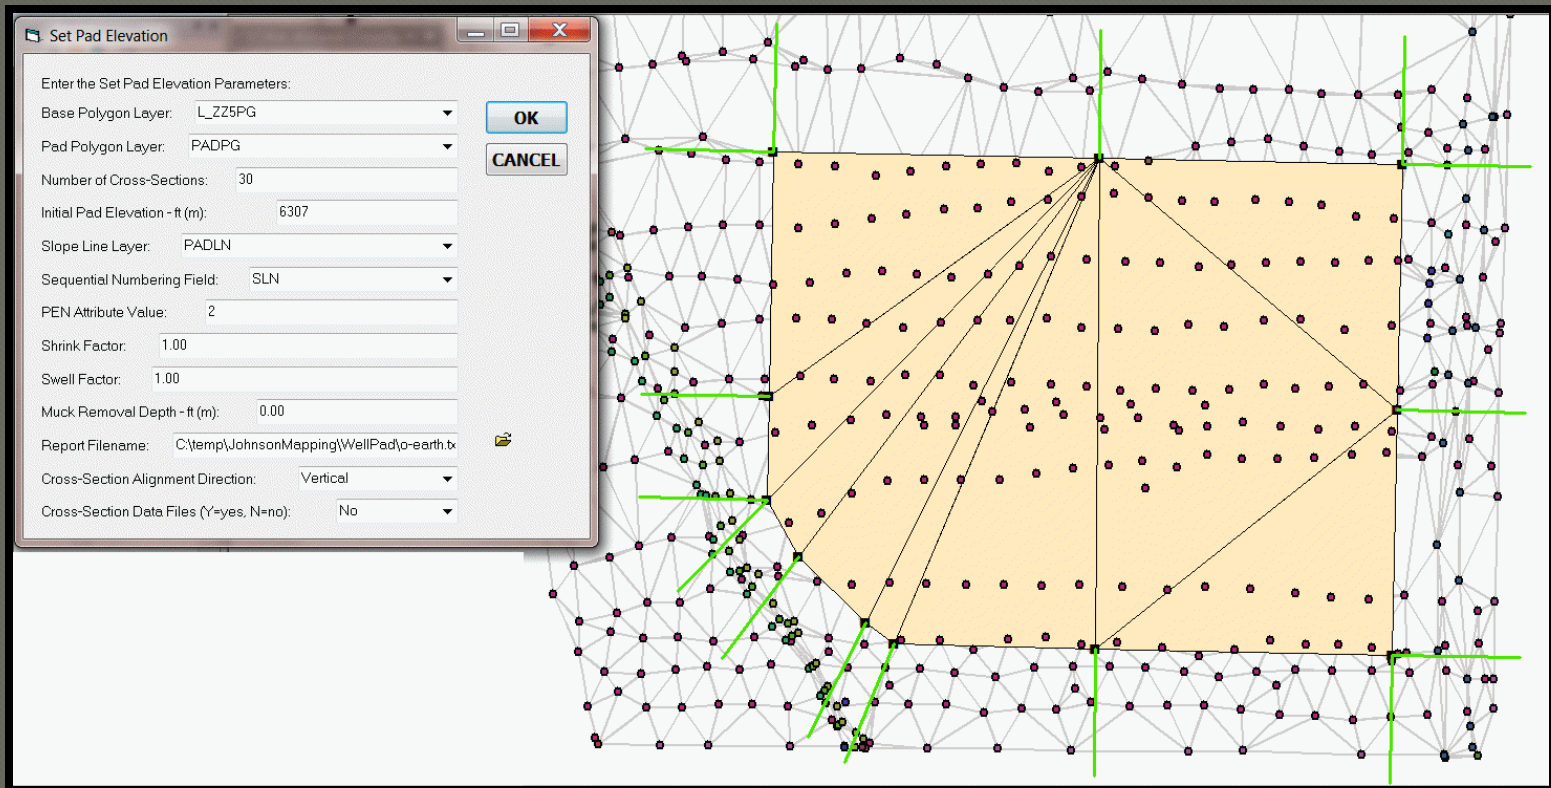

# Developing the Well Pad Surface

Using cross-sections, the control elevation is raised or lowered until the cut and fill values are “equal”

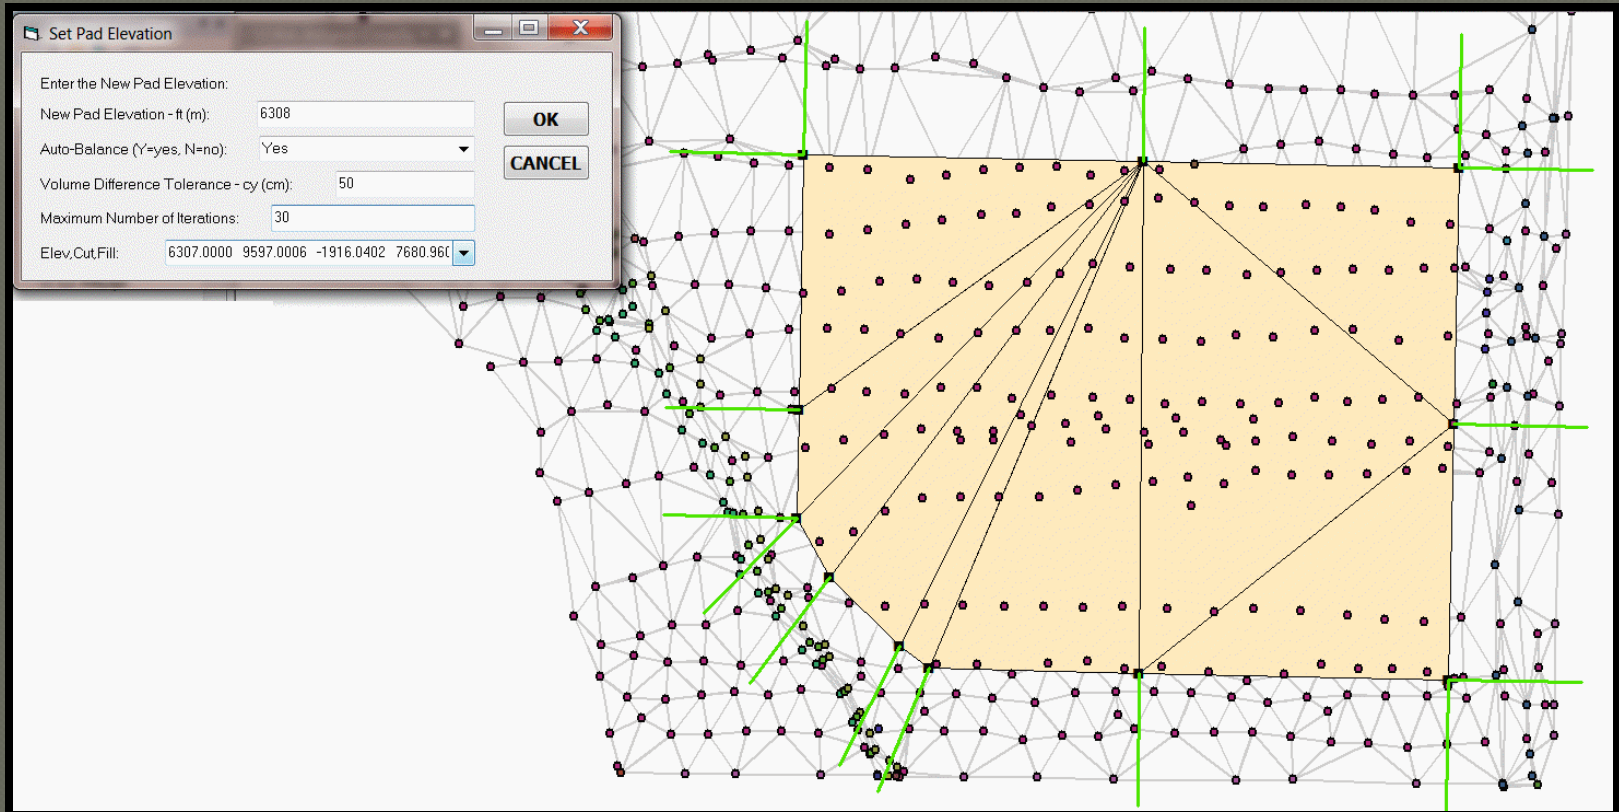

# Developing the Well Pad Surface

**[Set Well Pad Elevation] command**  
**Base Layer, Pad Layer, Initial Pad Elevation,**  
**Slope Line Layer, Shrink, Swell, Muck, Report File, etc.**

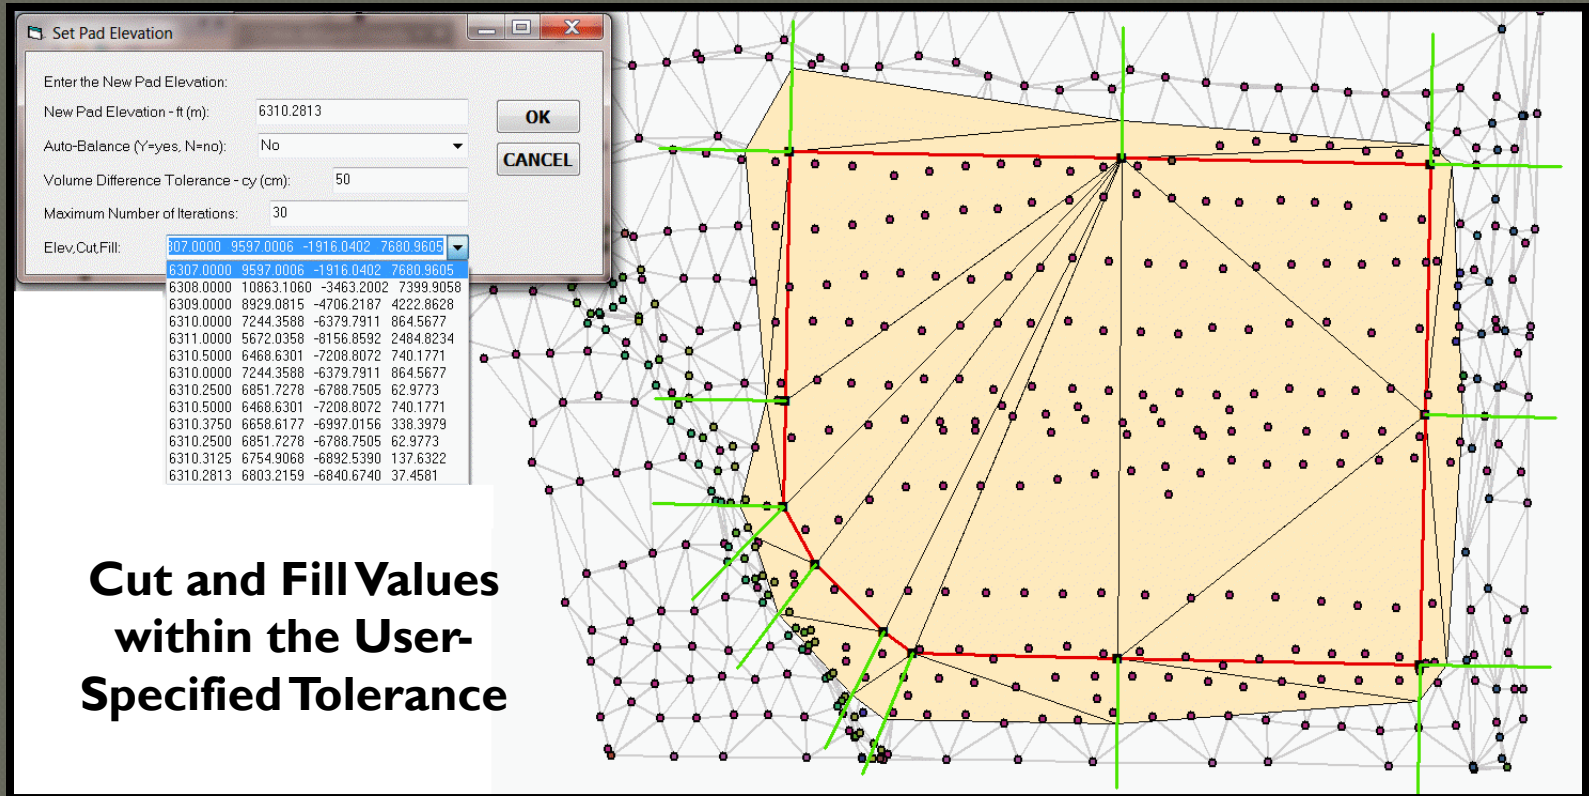

# Developing the Well Pad Surface

## Iterative Process to balance Earthwork Within a User-Specified Tolerance

# Developing the Well Pad Surface

**Final Computed Elevation with Polygons which tie the Pad Surface to the Original Ground Surface Added to the Pad Layer**

# Developing the Well Pad Surface

## Earthwork Summary Table

Table contains each iteration with the Pad Elevation, Cut Volume, Fill Volume and Difference values

o-earthTBL.txt

	PAD_ELEV	CUT_VOL	FILL_VOL	DIFF	OBJECTID *

# Emma asks how to perform

## Routing Heavy/Wide Vehicles for Safety

“Emma says this is a purr-fect application for Network Analyst”

# Bachman-Turner Overdrive

## “Roll on Down the Highway”

Unofficial Theme Song of Truckers

No GPS in  
1974

# The Routing Problem

**Routing Heavy and Wide Load Vehicles differs from routing passenger vehicles**

**Truck characteristics need to be included in the routing process which conventional navigation systems do not take into account**

# Vertical Clearance Issue

Typical Trailer Height 13' to 13'-6"

New York  
State  
experiences  
~200 bridge  
strikes  
annually

# Vertical Clearance Issue

NYS DOT estimates 81% of bridge strikes due to trucks using non-commercial navigation systems

From 2005 – 2008 ~5,000 Bridge Strikes in the U.S.

# Horizontal Turning Restrictions

Single Trailer Lengths typically 45', 48', 53'

Truck Drivers using some kind of GPS System

2007 – 11%, 2008 – 19%, 2008 – 27%, 2012 – 54%

# Trailer Length Issue

Wind Turbine Blade Radius varies from 130' to 300'

59% of truckers determine their own route/directions  
28% have their carrier provide route/directions  
12% use combination of own and carrier  
1% from special permit

# Routing Solution using ArcGIS

## Network Analyst

Street Centerline Dataset

Network Dataset

User Created

StreetMap Premium (TomTom,HERE)

Route Analysis Layer

Network Analysis Service (ArcGIS Server)

User Created

World Route

StreetMap Premium (TomTom,HERE)

# Network Datasets Elements

## Junctions, Edges and Turns

How  
elements are  
connected  
determines  
the route

2D/3D

# Network Dataset Attributes

Network attributes are properties of the network elements that control traversability over the network

Attribute	ParameterName	Value
Height	Height Restriction	0
Weight	Weight Restriction	0
Speed	Desired Speed	0
Oneway	Oneway	Prohibited
Truck	Driving a Truck	Avoid_High
Toll_Road	Avoid Toll Roads	Prohibited

# Available Network Datasets

**User-Created**, using any available street centerline dataset the user builds from scratch a Network Dataset.

**ESRI World Route** routing service, which replaces the ESRI basic routing service, and offers world-wide coverage, without the ability to account for height, weight and hazardous material restrictions.

**StreetMap Premium – TomTom** based, which provides world-wide coverage with the ability to account for height, weight and hazardous material restrictions.

**StreetMap Premium – HERE** based, which provides world-wide coverage with the ability to account for height, weight and hazardous material restrictions.

# User Created Network Datasets

## Advantages

- Total Control of the street database
- Any desired attributes can be added

## Disadvantages

- Very time consuming when dealing with large areas
- User is responsible for obtaining:
  - street centerline dataset
  - roadway speed limits
  - roadway direction
  - roadway attributes used for directions, etc.

# World Route/StreetMap Premium Network Datasets

## Advantages

Mature datasets that have existed for years

Large area coverage

Ready-to-go Network Analysis Layer

## Disadvantages

Inability to modify the street centerline database

Annual license fee (desktop \$, server \$\$\$)

# Network Datasets Comparison

Routing Service	Impedances	Restrictions	Parameterized Restrictions
Sample User-Defined	2	5	3
ESRI World Route	2	19	0
StreetMap – TomTom	8	32	6
StreetMap – HERE	5	32	8

The route that is generated is based upon the settings of the Network's Impedance and Restrictions

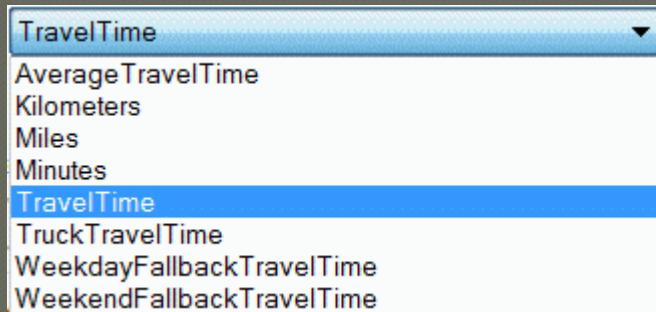

# Network Datasets Impedances

# Route Exported to Google Earth - KML

# Summary

It is possible to customize ArcGIS in a variety of manners to add specific functionality not available in native ArcGIS.

This can be a specific tool or command or a complete application.

ArcGIS provides the user-interface and database functionality for customization.
