The CEDRA Corporation's **COMMAND OF THE MONTH**

A monthly information bulletin

October 2009

FEATURED COMMAND

ArcGIS Server Edit Features & Map Tips

Application Description

Over the last two months we have discussed the CEDRA [Identify], [BufferP], and [BufferF] tools for ArcGIS Server which provide the user the ability to:

- (a) identify a feature, with or without related data,
- (b) select features within a circular buffer about a point and
- (c) select features within a buffer about a selected feature, respectively,

Continuing with the ArcGIS Server theme, this month we would like to discuss the application of editing and displaying feature attributes.

The basis for this application is to simulate the functionality offered in the CEDRA-DataEditorsoftware, which has been discussed in the **November 2007** and **February 2005** issues of Command of the Month.

The CEDRA Solution

To address this application, The CEDRA Corporation has developed three custom tools:

[EditFeat], IIII, which enables the user to display and edit specific attributes associated with a feature, which loads the contents of the Theme Attribute Data File into the current session and which displays specific attributes of a selected

feature in an informa-

tion message box.

Like the [ldentify], [BufferP] and [BufferF] tools discussed in the last two issues, the [EditFeat], [Reload] and [MapTips] tools can be added to any existing Web Application, whose application code is VB.NET based, using the Microsoft Notepad program. In so doing, the user is able to customize a Web Application without having to use an IDE, such as Microsoft Visual Studio.

Modifying the Web Application

Building upon the application developed in the **September 2009** issue of Command of the Month, we will add the [EditFeat], [Reload] and [MapTips] tools to the Test4 application.

Command Of The Month bulletin

This month's issue discusses how custom tools which display and edit specific feature attributes can be added to an ArcGIS Server Web based application.

The same approach discussed in last month's issue will be used to add the above mentioned three tools. That is to say, Notepad will be used to modify two existing files, while new files will be added to the App_Code and Images folders.

CEDRA DataEditor Tools Overview

The CEDRA-DataEditor tools developed for ArcGIS Server operate on the same premise as the desktop version of the software. That is, the user establishes a Theme Attribute Data File, which is called **themes.txt**, that contains the layers and the attributes that are to appear in a multi-input dialog box. As a matter of fact, the desktop version of the **themes.txt** file is identical to that for ArcGIS Server.

Using the information in this file, the tools will extract the appropriate information for a feature and build a dialog box, on the fly, to contain this information as per the user's specifications.

Implementing the CEDRA DataEditor Tools

The following steps describe how the DataEditor tools can be incorporated into the Test4 Web Application discussed in last month's issue.

- 1. Copy the following files into the App_Code folder.
 - DatCalcValue.vb DatLoadAttributes.vb DatMapTips.vb DatModAttributes.vb DatRemoveDQ.vb DatStoreFeature.vb AvenueWraps.vb CEDRAGeometry.vb
- Copy the following files into the Images folder.
 DATEDIT1.GIF
 DATEDIT2.GIF
 MapTip.GIF

The above three files are the icons for the [EditFeat], [Reload] and [MapTips] tools, respectively.

ArcGIS Server, and ArcGIS are registered trademarks of Environmental Systems Research Institute, Inc. All World Rights Reserved. Modify the Default.aspx.vb file, using Notepad, by adding Code Block A above the line:

End Class

This is the last line in the Default.aspx.vb file.

- 4. Select the {File} [Save] command to save the modifications and then the {File} [Exit] command to exit Notepad.
- Modify the Default.aspx file, using Notepad, as shown in Code Block
 B. Specifically, modify the Width property value shown in Code Block
 B to be 500px. This property controls the width of the toolbar. As tools are added to the toolbar, if the width of the toolbar is not increased, the tools will begin to encroach on each other.

Furthermore, it is possible to control the default active tool on the toolbar via the CurrentTool property. For example the default active tool could be changed from MapPan to MapZoomIn, if so desired. The name that is used in the CurrentTool property is derived from the Name property as shown in Code Block C. That is, the name that appears in the **<esri:Tool** tag.

 Modify the Default.aspx file, using Notepad, as shown in Code Blocks C, D and E. The modification identified in Block C will be made towards the top of the Default.aspx file, while Code Block E will appear immediately below Code Block D, which goes just above the line:

</form>

The </form> line appears toward the very bottom of the Default.aspx file.

7. Select the {File} [Save] command to save the modifications and then

the {File} [Exit] command to exit Notepad.

- 8. Invoke ArcGIS Server Manager and log in.
- 9. Click on the Applications tab and select the Web Applications menu item. A list of the published Web Applications should appear on the screen.
- 10. Right-click on the Test4 application and select the Edit menu item from the pop-up menu list.
- 11. A message box stating that the application has been modified external to Manager will appear. Click the Yes button to import the modified Web Application. If all goes well the Edit Web Application dialog box should appear.

If not, an error was detected in the Web Application and a message to that effect will be displayed. At this point exit Manager and check the modifications that were made to the files: Default.aspx and Default.aspx.vb.

12. Click the **Finish** button to rebuild the application. Once the application has been rebuilt it should appear in the Web browser.

Using the EditFeat Tool

The [EditFeat] tool operates on the basis that the user makes a pick in the map area, from which, the tool determines which feature is closest to the pick.

Once the feature has been found, the tool reviews the information in the Theme Attribute Data File searching for the name of the layer in which the selected feature resides.

If the layer name is not found, an error message to this effect is displayed. If the layer name is found, the tool displays a dialog box containing the attributes that are specified in the Theme Attribute Data File.

In determining which feature was selected, the tool searches the current active layer. Thus, the [Set Active Layer] tool must be selected prior to activating this tool.

Shown in Figure 1 is a dialog box built by the [EditFeat] tool using information that appears in the Theme Attribute Data File. Note that the dialog box can contain data field and drop-down lists.

To use this tool the user should perform the following:

Select the [Set Active Layer] tool,
 and pick the layer from the drop-

down list that is to serve as the current active layer.

- 2. Select the [Reload] tool, 🚈
- 3. Select the [EditFeat] tool, m.
- 4. Make a pick in the map area to select the desired feature.
- 5a. If a feature was not found, an appropriate error message will be displayed. Close the information box and repeat Step 4.
- 5b. If a feature was found that does not appear in the Theme Attribute Data File, an appropriate error message will be displayed. Close the information box and repeat Step 4.
- 5c. If a feature was found and whose associated layer name appears in the Theme Attribute Data File, a multi-input dialog, similar to that shown in Figure 1, will be displayed. Accept or modify the values and then click the OK button to alter the feature attribute values, or the cancel button to abort the operation.
- 6. Repeat Step 4 or select another tool or command.

Using the Reload Tool

The [Reload] tool imports into the current Web Application session the contents of the Theme Attribute Data File.

To use this tool the user should perform the following:

- 1. Select the [Reload] tool.
- Dismiss the information message box or click another CEDRA tool or command.

The information message box will contain: (a) a message similar to that shown in Figure 2, stating the number of themes (layers) read from the Theme Attribute Data File, or (b) an error mes-

Reload the Theme Attribute Data File

1 user-defined theme has been read from the themes.txt file, located in: C:\Inetpub\wwwroot\test\DataEditor

Figure 2 - Reload Tool Information Message Box

sage indicating a problem that was encountered during the processing.

If an error message is displayed, the Theme Attribute Data File will need to be modified and the [Reload] tool reselected.

Using the MapTips Tool

The [MapTips] tool operates on the basis that the user makes a pick in the map area, from which, the tool determines which feature is closest to the pick.

Once the feature has been found, the tool reviews the information in the Theme Attribute Data File searching for the name of the layer in which the selected feature resides.

If the layer name is not found, an error message to this effect is displayed. If the layer name is found, the tool displays a dialog box containing the attributes that are specified in the Theme Attribute Data File.

In determining which feature was selected, the tool searches the current active layer. Thus, the [Set Active Layer] tool must be selected prior to activating this tool.

Shown in Figure 3 is an information mes-

sage box built by the [MapTips] tool using information that appears in the Theme Attribute Data File.

To use this tool the user should perform the following:

- Select the [Set Active Layer] tool,
 and pick the layer from the dropdown list that is to serve as the current active layer.
- 2. Select the [Reload] tool, 🚈.
- 3. Select the [MapTips] tool, F.
- 4. Make a pick in the map area to select the desired feature.
- 5a. If a feature was not found, an appropriate error message will be displayed. Close the information box and repeat Step 4.
- 5b. If a feature was found that does not appear in the Theme Attribute Data File, an appropriate error message will be displayed. Close the information box and repeat Step 4.

Figure 3 - MapTips Tool Information Message Box

- 5c. If a feature was found and whose associated layer name appears in the Theme Attribute Data File, an information message box, similar to that shown in Figure 3, will be displayed.
- 6. Repeat Step 4, close the information message box or select another CEDRA tool or command.

Notes

- a. The [Set Active Layer] tool needs to be selected only once during a Web Application session, provided that the current active layer does not change. That is to say, this tool should be selected only if the current active layer is to change. The current active layer remains in effect until changed by re-selecting the [Set Active Layer] tool.
- **b.** The [Reload] tool needs to be selected only one during a Web Application session, provided that the Theme Attribute Data File is not modified. So that once the Theme Attribute Data File has been read, there is no need to reload the file

unless there has been some modification to the file.

- c. When using the [EditFeat] tool once the OK button is selected the database is altered. There is no Undo capability.
- When using the [EditFeat], [Reload] and [MapTips] tools the user is able to close the dialog boxes by clicking the x in the upper right corner of the dialog box. In the case of the [EditFeat] tool, this is equivalent to clicking the Cancel button.
- e. When using the [EditFeat], [Reload] and [MapTips] tools the user is able to move the dialog boxes by clicking in the title bar of the dialog box, holding down the left button and then moving the cursor to the desired new location. At this point, release the left mouse button.
- **f.** A maximum of 30 attributes can be displayed by the [EditFeat] tool.
- **g.** Unlike the desktop version of the CEDRA-DataEditor software, the ArcGIS Server implementation of

the software does not support a Back button. The software will only display a single dialog box of attributes.

- **h.** There is no limit to the number of attributes that the [MapTips] tool can display. The reason for this is that the [MapTips] tool creates a single string that is displayed by the tool.
- i. Shown in Figures 4, 5 and 6 are the controls that are used in the DataEditorDiv, MapTipDiv and processMessage dialog boxes, which are employed by the [EditFeat], [MapTips] and [Reload] tools, respectively. These controls are defined in the Default.aspx file, while the code which handles the events for these controls appears in the Default.aspx.vb file.
- **j.** In displaying the DataEditorDiv, the function popDEParam is called to control the visibility and default values of the appropriate controls, after which, the function showDataEditor is called to display the dialog box.

- **k.** The [EditFeat] and [MapTips] tools will display their respective dialog boxes below and to the right of the pick made by the user.
- When reviewing the Code Blocks, the lines which appear in green are comment lines and are included to improve the readability of the file.

Summary

As users migrate to Web based applications, the ability to incorporate custom tools becomes more and more important. Therefore, the ability to incorporate custom tools, without having to add staff that is programming knowledgable, is beneficial. As such, the approach discussed in this month's issue of Command of the Month should be helpful in this regard. For those who are interested in acquiring the source code for the [EditFeat], [Reload] and [MapTips] tools, as well as code blocks A through E, contact: Lisa Stone at lstone@cedra.com.

As always, should the reader have any suggestions on functionality that should be featured in Command of the Month, please feel free to forward them on to us.

Figure 5 - MapTipDiv Dialog Box Controls - see Code Block D

Figure 6 - processMessage Dialog Box Controls - see Code Block F

If you have a request for Command Of The Month, feel free to phone, fax or e-mail your request to The CEDRA Corporation.
